1. Product Overview

Klaim is a social cashback mobile application operating in the UAE market. The product's core premise is simple: users link their bank card once, receive personalized restaurant offers ("Drops") twice weekly, pay normally at participating venues, and receive cashback automatically to their bank account — with no QR codes, voucher codes, or cashier interaction required.

The product is live in Dubai and Abu Dhabi, with coverage expanding to Sharjah and Ras Al Khaimah. As of the time of writing, Klaim reports over 4,800 active users in the UAE. The app is free for diners; revenue is generated through a take rate charged to partner restaurants.

The MVP screenshots analyzed in this document reflect the current state of the application across all five primary navigation tabs: **Drops**, **Redeemed**, **Friends**, **Trade**, and **Profile**.

2. Competitive Context: Klaim vs. Claim.co

Claim (claim.co) is Klaim's primary US-market analog. Originally an independent startup, Claim was acquired by Wonder Group and now operates as "Claim by Grubhub." Understanding the similarities and differences between the two products is essential for identifying where Klaim's MVP currently stands and where it can differentiate further.

Dimension	Klaim	Claim (claim.co)
Market	UAE (Dubai, Abu Dhabi, Sharjah)	United States (multiple cities)
Drop Cadence	Twice weekly (Monday & Friday)	Weekly (Thursday)
Payout Method	Direct bank transfer via Lean Open Banking	Venmo (automatic)
Banking Integration	Lean (MENA Open Banking)	Card-linked offer detection
Social Features	Drop Buddies, Trade, Gift, Friend Activity Feed	Drop Buddies, Trading
Invite Incentive	\$10 cashback for both parties	Referral program
Invite Channel	WhatsApp (deep-link to pre-written message)	In-app sharing
Tagline	“Get Paid to Go There”	“Get Paid to Go There”
Acquisition Status	Independent startup	Acquired by Wonder/Grubhub
Languages	Arabic & English	English

The identical tagline is notable — both products have converged on the same core messaging. Klaim’s key advantages are its higher drop frequency, direct bank payout (vs. Venmo dependency), and the WhatsApp-native referral flow, which is highly relevant in the UAE market where WhatsApp is the dominant messaging platform.

3. Global Design System

The Klaim MVP employs a consistent and distinctive visual language across all screens. The design system is built around a dark-mode-first aesthetic with high-contrast neon accents, targeting a young, urban demographic.

3.1 Color System

The interface uses a deliberate, limited palette that creates strong visual hierarchy.

Role	Description	Usage
Background	Deep purple (approx. #1A1040)	All screen backgrounds
Surface	Slightly lighter purple	Cards, modals, input containers
Primary Accent	Neon green (approx. #AAFF00)	Primary CTAs, active nav items, cashback amounts, headline highlights
Secondary Accent	Amber/Gold	Time-sensitive badges (“5d left”), secondary CTAs, friend invite button outline
Tertiary Accent	Muted lavender/purple	Section labels, body text, inactive nav icons
Success / Active	Bright green	Status badges (“Active”, “Available now”, “+cashback sent” banners)
Neutral	White	Primary body text, card titles, amounts

3.2 Typography

The type system relies on a heavy display font for headlines to create impact, paired with a clean sans-serif for body copy.

Element	Style	Color
Screen headline (line 1)	Black/Heavy weight, large	White
Screen headline (line 2)	Black/Heavy weight, large	Neon green
Section labels	Small caps, spaced	Muted lavender
Card titles	Bold, medium	White
Cashback amounts	Bold, medium	Neon green
Supporting text	Regular, small	Muted white/lavender
Badge text	Bold, extra small	Varies by badge type

3.3 Interactive Components

Cards (Drop Cards): Tall, rounded-corner cards arranged in a 2-column grid. The upper portion is a colored image area with a status badge overlaid in the top-right corner. The lower portion contains the brand name, cashback amount (in neon green), and minimum spend.

List Items (Nearby Partners, Tradeable Claims): Full-width rows with a brand icon on the left, text content in the center, and a value/action on the right. Status badges appear below the descriptive text.

Buttons: Three distinct button styles are used consistently throughout the app:

- **Primary:** Full-width, rounded rectangle with a neon green or purple fill and white/green label.
- **Secondary:** Full-width, rounded rectangle with a dark fill and white label.
- **Outlined:** Full-width, rounded rectangle with a transparent fill, colored border, and matching label.

Badges/Pills: Small, rounded pill shapes used for status communication. Color encodes meaning: neon green for “NEW”, amber for time-remaining, green for active/available, and purple for pending actions.

Modals: Full-screen-height bottom sheets with a slightly lighter background surface, used for confirmations and multi-step interactions (Invite, Trade initiation).

4. Application Architecture: Navigation & Information Hierarchy

The application is structured around a persistent bottom navigation bar containing five primary sections. The active tab is indicated by a rounded purple square highlight behind the icon, with the label rendered in white.

CONTENT AREA (Screen-specific)				
Drops (K logo)	Redeemed (✓ check)	Friends (○ ring)	Trade (⇌ swap)	Profile (🕒 clock)

The information hierarchy within each tab follows a consistent pattern: a section label in small caps, followed by a large two-tone headline, then supporting body copy, and finally the primary content area. This pattern creates a predictable reading flow for users navigating between tabs.

5. Screen-by-Screen Feature Specification

5.1 Drops Tab — Home Screen

Purpose: The primary discovery surface where users view and select their current week’s personalized cashback offers.

Screen Layout (Top to Bottom):

The screen opens with the section label “THIS WEEK’S DROPS” followed by the headline “Get paid to / go there.” in the two-tone style. Immediately below is a live countdown pill displaying the time until the next drop cycle (e.g., “Next drop in 5d 14h 21m”), with a green dot indicating the system is active.

A brief explainer paragraph reinforces the cadence: drops arrive every Monday and Friday, and unused redeemed offers expire when the next drop goes live.

Drop Buddies Banner: A full-width card with overlapping friend avatars on the left and the text “Drop Buddies active — 3 friends have the same drop” on the right, with a “Plan →” action link. This banner is contextual and appears when one or more friends hold the same drop as the current user.

“Your Claims” Grid: A 2-column card grid presenting the user’s personalized offers for the current cycle. Each card contains:

- A large image/icon area with a colored background.
- A status badge in the top-right corner of the image area.
- The brand name in bold white text.
- The cashback value in neon green (e.g., “\$12 back”).
- The minimum spend requirement in muted text (e.g., “Min. spend \$12”).

Status Badge Types Observed:

Badge	Color	Meaning
NEW	Neon green	Offer appeared for the first time this cycle
Xd left	Amber/Gold	Number of days remaining before the offer expires

Cashback Confirmation Banner: An inline notification banner (green background) appears when a recent cashback has been processed, displaying the amount and the venue (e.g., “+\$12.00 cashback sent — Sweetgreen · redeemed yesterday”).

“Nearby Partners” Section: Below the primary claims grid, a secondary section lists additional partner venues available in the user’s vicinity. These are displayed as list items rather than cards, with the venue name, minimum spend, cashback value, and an availability badge. Two states are observed: “Available now” (green badge) and “Klaim to unlock” (amber badge), the latter suggesting a gating mechanism for certain venues.

5.2 Redeemed Tab — Wallet

Purpose: A historical record of all offers the user has activated and used, functioning as a lightweight transaction wallet.

Screen Layout:

The screen opens with the section label “YOUR WALLET” and the headline “Redeemed offers.” followed by the expiration policy explainer: “Fresh drops every Monday and Friday morning. Redeemed offers you have not used expire when the next drop goes live. Finish your purchase before the next drop — anything unused expires when new drops go live.”

Empty State: When no offers have been redeemed, the screen displays a centered card with the message “No redeemed offers yet” and the guidance “When you redeem a drop on the Drops tab, it will show up here.” This is a clean, functional empty state that correctly directs the user to the action required to populate the screen.

5.3 Friends Tab — Social Hub

Purpose: The social layer of the application, combining a friend activity feed with tools for growing the user’s network and coordinating shared experiences.

Screen Layout:

The section label “SOCIAL” precedes the headline “Benefits / with friends.” Two primary action buttons appear at the top of the content area:

1. **“Invite friends • both get \$10”** — A pill button with neon green text on a dark purple background, representing the referral program.
2. **“Find friends by contact”** — An outlined pill button with an amber/gold border, allowing users to discover existing Klaim users from their phone contacts.

Drop Buddy Suggestion Card: A contextual card showing overlapping friend avatars and the message “2 buddies have Blue Bottle — Plan a visit together this week” with a “Plan →” action link. This is a proactive social nudge to convert individual offers into shared experiences.

Friend Activity Feed: A chronological list of friends’ recent actions on the platform. Each item includes the friend’s avatar (initials-based), their name, a description of the action, a timestamp, and a colored tag indicating the action type.

Action Type	Tag Color	Example
Redemption	Neon green	”+\$7 cashback”
Gift received	Amber/Gold	“Gift received”
Trade request	Purple	“Trade request”

The feed creates a social proof loop: users see friends saving money and receiving gifts, which reinforces the value of the platform and encourages engagement.

5.4 Trade Tab — Marketplace

Purpose: A peer-to-peer exchange mechanism allowing users to swap unwanted offers with friends, maximizing the utility of each drop cycle.

Screen Layout:

The section label “TRADING” precedes the headline “Swap Klaims / with friends.” The screen is divided into two functional sections.

Incoming Offers: Displays pending trade proposals from friends. Each offer card includes:

- The sender’s name and timestamp (e.g., “From Maya Kim · 1h ago”).
- A descriptive title of the proposed swap (e.g., “Boba Guys for Sweetgreen?”).
- A visual representation of the swap: the offering brand’s icon, an arrow, and the requested brand’s icon.
- A detailed description of the value exchange (e.g., “Maya’s offering her Boba Guys *9 Klaim* for your Sweetgreen *12 Klaim*”).
- Two action buttons: “**Accept**” (highlighted, primary) and “**Decline**” (secondary).

Your Tradeable Claims: A list of the user’s current offers that are eligible for trading. Each item shows the brand icon, name, minimum spend, and a readiness status (“ready to trade”), with an “Offer trade” button on the right.

5.5 Profile Tab — Account & Settings

Purpose: The user’s personal dashboard, combining identity, performance statistics, brand history, and payment method management.

Screen Layout (Two-Screen Scroll):

The profile screen is taller than the viewport and requires scrolling. The top portion displays the user’s identity and preferences; the bottom portion manages financial connections.

Identity Section:

- A circular avatar displaying the user’s initials (e.g., “YO”) on a purple background.

- The “YOUR PROFILE” label above the headline “Claim / your way.” in two-tone style.
- The user’s display name, handle, and city (e.g., “@yourhandle · Boston, MA”).
- Two status badge pills: “Verified spender” and “Early Claimer”, indicating account trust level and early adopter status.

Dark Mode Toggle: A full-width toggle row with the label “Dark mode” and the description “Deep purple background and neon accents.” The toggle is shown in the ON state (neon green).

Statistics Row: Three equal-width columns displaying aggregate lifetime metrics:

- **\$134 SAVED** — Total cashback earned.
- **23 REDEEMED** — Total offers utilized.
- **6 INVITED** — Total successful referrals.

Your Brand History: A tag cloud of brands the user has visited through Klaim, with visit counts (e.g., “Blue Bottle ×8”, “Sweetgreen ×5”). This section serves both as a personal record and a social identity signal.

Linked Card Section (Scrolled View): Two connected accounts are displayed as list items:

1. **Visa · · · · 4242** — “Connected via Lean · secure” with an “Active” green badge. This is the spending card used for transaction detection.
2. **Linked bank · AE · · 4242** — “Cashback sent here automatically” with a “Connected” green badge. This is the payout account.

The separation of the spending card (for detection) and the bank account (for payout) is an important UX distinction that should be clearly communicated to users during onboarding.

6. Core User Flows

Flow 1: First-Time User Onboarding (Inferred)

While the onboarding screens are not included in the provided screenshots, the Profile tab's "Linked Card" section and the website's description of the setup process allow for the following inference:

1. User downloads the app and creates an account (name, handle, location).
2. User links their spending card via Lean (Open Banking flow, external to the app).
3. User links their bank account for cashback payouts via Lean.
4. User lands on the Drops tab and views their first personalized drop.

Flow 2: Discovering and Using a Drop

This is the primary value-delivery flow and the most critical path in the application.

1. User opens the app on Monday or Friday (drop day) and sees new offers on the Drops tab.
2. User reviews the 2-column grid of "Your Claims", noting the cashback value and minimum spend for each.
3. User selects a preferred offer (e.g., Sweetgreen for 12% minimum spend).
4. User visits the restaurant and pays normally with their linked card.
5. The Lean integration detects the qualifying transaction automatically.
6. Within minutes, the cashback amount is transferred to the user's linked bank account.
7. A confirmation banner appears on the Drops tab on the user's next app visit (e.g., "+\$12.00 cashback sent — Sweetgreen · redeemed yesterday").
8. The utilized offer appears in the Redeemed tab.

Flow 3: Trading an Unwanted Offer

1. User navigates to the Trade tab.

2. User identifies an offer they do not want under “Your Tradeable Claims” and taps “Offer trade”.
3. A “Choose a Drop Buddy” modal appears, listing friends who are marked as “Same drop · Ready to trade”.
4. User selects a friend (e.g., Jordan) to initiate the trade proposal.
5. The friend receives a trade request visible in their Trade tab’s “Incoming Offers” section and in the Friend Activity feed.
6. The friend reviews the proposed swap (showing both brand icons and values) and taps “Accept” or “Decline”.
7. If accepted, the offers are swapped instantly between the two users’ accounts.

Flow 4: Inviting a Friend via WhatsApp

1. User navigates to the Friends tab.
2. User taps “Invite friends · both get \$10”.
3. An “Invite friends” modal appears, explaining the mutual \$10 cashback reward.
4. The modal displays a pre-written message preview: *“Klaim is a free app for restaurant cashback — weekly drops at partner spots, pay with your linked card, and get paid back automatically. No codes to show at the till. I’m inviting you to join. When you sign up with my link, we both get \$10 cashback.”*
5. User taps “Open WhatsApp”, which deep-links to the WhatsApp app with the pre-written message pre-populated.
6. User selects the recipient(s) in WhatsApp and sends the message.
7. When the invitee signs up using the referral link, both parties receive the \$10 cashback.

Flow 5: Coordinating with Drop Buddies

1. The app detects that one or more of the user’s friends hold the same drop.
2. A “Drop Buddies active” banner appears on the Drops tab and a suggestion card appears on the Friends tab.
3. User taps “Plan →” to initiate coordination (exact behavior of this flow not fully visible in screenshots, suggesting a future screen or modal).

4. Friends can coordinate a joint visit to the shared venue.

7. Modal & Overlay Interactions

The MVP uses two primary modal patterns for multi-step interactions.

7.1 Invite Friends Modal

Trigger: Tapping “Invite friends · both get \$10” on the Friends tab.

Type: Bottom sheet overlay.

Content: Title, incentive description, message preview (scrollable), primary CTA (“Open WhatsApp”), and a “Cancel” button.

Behavior: The “Open WhatsApp” button deep-links to WhatsApp with the pre-written referral message. “Cancel” dismisses the modal.

7.2 Choose a Drop Buddy Modal (Trade Initiation)

Trigger: Tapping “Offer trade” on a tradeable claim in the Trade tab.

Type: Bottom sheet overlay.

Content: Title (“Choose a Drop Buddy”), instructional copy, a list of eligible friends (each showing avatar, name, status “Same drop · Ready to trade”, and a “Choose” button), and a “Cancel” button.

Behavior: Tapping “Choose” next to a friend initiates the trade proposal flow. “Cancel” dismisses the modal and returns to the Trade tab.

8. UX/UI Observations & Improvement Recommendations

The following observations are based on a thorough analysis of the MVP screens and a comparison with the Claim.co product. These are intended as actionable inputs for the engineering and product design teams.

8.1 Terminology Clarity: “Redeem” vs. “Use”

Observation: The app uses the word “Redeem” in two distinct contexts: (a) selecting/claiming an offer in the app (the Redeemed tab), and (b) the physical act of spending at the restaurant. This creates potential confusion, as a user might believe they have “redeemed” an offer simply by selecting it, without understanding they still need to visit the venue.

Recommendation: Adopt a clearer two-stage vocabulary. Consider “Claim” for the in-app selection step and “Used” or “Spent” for the post-transaction state. The Redeemed tab could be renamed “Wallet” or “Active Claims” to better reflect its function.

8.2 Onboarding & Card Linking Flow

Observation: The Profile tab reveals that users must link two separate accounts — a spending card (for transaction detection) and a bank account (for payout). This two-step financial setup is non-trivial and may cause drop-off during onboarding.

Recommendation: The onboarding flow should clearly explain why two accounts are needed (one to detect the spend, one to receive the cashback) before the user enters the Lean Open Banking flow. Consider a visual diagram or a short animated explainer within the onboarding sequence.

8.3 Empty State on Redeemed Tab

Observation: The empty state on the Redeemed tab is functional but minimal. A new user who has just signed up will see this screen and may not immediately understand the full value loop.

Recommendation: Enhance the empty state with a brief visual walkthrough (e.g., a 3-step mini-tutorial: “1. Pick a drop → 2. Go eat → 3. See your cashback here”). This reinforces the core value proposition at the exact moment the user is most likely to be uncertain about how the product works.

8.4 “Klaim to Unlock” Mechanic

Observation: The Drops tab’s “Nearby Partners” section shows a “Klaim to unlock” badge on certain venues (e.g., Boba Guys). The mechanism for unlocking these offers

is not explained in the visible UI.

Recommendation: Add a brief tooltip or expandable explanation on the “Klaim to unlock” badge to clarify what action is required (e.g., “Redeem 3 drops to unlock this partner”). This transforms an opaque gate into a motivating progression mechanic.

8.5 Trade Tab — Value Asymmetry Communication

Observation: The incoming trade offer from Maya Kim proposes exchanging a *9BobaGuysKlaim* for a *12 Sweetgreen Klaim* — a \$3 value difference. The UI presents this clearly in the description text, but the “Accept” button is the visually dominant action. A user might accept an unfavorable trade without fully registering the value difference.

Recommendation: Add a visual value comparison indicator within the trade offer card (e.g., “9 → 12” with a color-coded indicator) to make the value delta immediately scannable before the user acts.

8.6 Friend Activity Feed — Actionability

Observation: The Friend Activity feed on the Friends tab shows events like “Maya Kim — Wants to trade · Boba Guys” with a “Trade request” tag. However, the feed item does not appear to have a direct action button; the user must navigate to the Trade tab to respond.

Recommendation: Add inline action buttons to feed items where a response is required (e.g., a “Review trade” button on trade request items). This reduces the number of steps required to respond to social interactions and increases engagement with the Trade feature.

8.7 Drop Buddies “Plan” Flow

Observation: Both the Drops tab and the Friends tab feature “Plan →” CTAs related to Drop Buddies, but the destination of this action is not visible in the provided screenshots. This suggests either an unimplemented feature or a screen not yet captured.

Recommendation: Ensure the “Plan” flow has a clear, functional destination — ideally a lightweight coordination screen where friends can confirm a shared visit date/time.

Even a simple “Notify friends you’re going today” button would close the loop on this social feature.

8.8 Accessibility: Text Contrast

Observation: Several text elements use a muted lavender color on a deep purple background (e.g., section labels, supporting body copy). While this creates visual hierarchy, the contrast ratio may not meet WCAG AA standards (minimum 4.5:1 for normal text).

Recommendation: Audit all text/background color pairings against WCAG AA contrast requirements. Increase the brightness of body text and section labels where necessary, without disrupting the overall dark-mode aesthetic.

8.9 Referral Flow — WhatsApp Dependency

Observation: The invite flow is built exclusively around WhatsApp, which is highly appropriate for the UAE market. However, the modal does not offer any alternative sharing method (e.g., copy link, SMS, email).

Recommendation: While WhatsApp should remain the primary CTA, add a secondary “Copy invite link” option for users who wish to share via other channels. This is a low-effort addition that broadens the top-of-funnel reach.

8.10 Profile — Brand History as Social Identity

Observation: The “Your Brand History” tag cloud is a compelling feature that transforms spending data into a form of social identity. However, in the current MVP, it appears to be display-only.

Recommendation: Consider making brand history shareable (e.g., a “Share my Klaim year in review” feature) or surfacing it in the Friend Activity feed. This could drive organic social sharing and brand awareness.
